Descriptive Epidemiology

Stage at Diagnosis: The presentation of lung cancer is extremely variable and depends on local manifestations of the tumor, distant metastases or associated paraneoplastic syndromes. In 2010, 15% of lung cancer patients were diagnosed at localized stage. The more advanced the stage, the poorer the prognosis is for the patient. In 2010, 304 (56%) cases were diagnosed when disease had progressed beyond the lung metastasized to a distant location. Approximately 83% of cases in 2010 were diagnosed after the disease had progressed beyond the lung to lymph nodes, regional areas, or distant sites, such as brain or bone

Incidence: Lung cancer is a major public health dilemma, with an estimated 222,520 new cases in

the United States in 2010. Despite the well documented link between tobacco product use and respiratory diseases, including cancer, the outcomes of such efforts to curb the use of tobacco products have been mixed. In South Dakota, there were 546 new invasive lung cancer cases diagnosed in 2010.

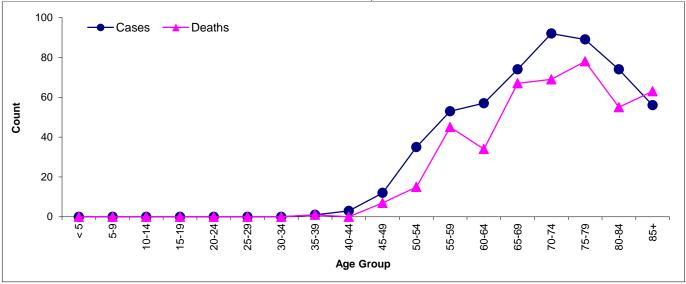

Mortality: There were 434 lung cancer deaths in South Dakota in 2010. Incidence and mortality rates have significantly increased during the last century. Lung cancer accounts for approximately 27.6% of all United States deaths attributed to cancer. In South Dakota, lung cancer accounts for 26.3% of deaths from cancer. Lung cancer is the leading cause of cancer deaths in both men and women.

Risk and Associated Factors: Cigarette smoking is by far the most important risk factor for lung cancer. Approximately 90% of lung cancer in men and 80% in women are attributed to cigarette smoking. The lifetime risk of lung cancer in nonsmokers is estimated to be less than 1%. Other risk factors include second hand smoke, and occupational or environmental exposures to substances such as arsenic, benzene, and asbestos.

Prevention and Early Detection: Efforts at early detection by screening have not been effective in reducing mortality rates significantly. Chest x-ray, analysis of cells in sputum and bronchial fiber optic examination are methods used in early diagnosis and detection. The best prevention of lung cancer is to stop smoking or never smoke.
